

TRIFOLIUM REPENS

Microclover™ - *Trifolium repens*

is a product of many years of natural selection that have resulted in revolutionary microclovers with all the benefits of traditional white clover packed into very tiny leaves.

Microclover™ “spoon feeds” nitrogen to the grass, producing a healthy, dense, and naturally green lawn that is easy to maintain. Microclover® was developed as a companion species to turfgrass and performs best in combination. If planted alone it requires mowing a minimum of 1x every three weeks at 2.5 inches or below.

The vigorous and dense growth of clover and grass together crowds out existing weeds and prevents new weeds from establishing. The unique dense stolon structure allows Microclover™ to tolerate exceptionally low mowing heights.

Microclover™ has been bred to stay green from spring to winter. The healthy growth of the accompanying grasses contributes to the overall attractive green color which remains throughout the year. Very little fertilizer, fungicides and water are required for Microclover™. It would be difficult to find a more environmentally friendly, cost effective, and low maintenance turf solution.
